EDUCATION

Northeastern University | Boston, MA
M.S. in Computer Science | GPA: 3.5/4.0 **Present**
Relevant Courses: Programming Design Paradigm, Database Management Systems, Algorithms

Saint Joseph's University | Philadelphia, PA
B.S. in Business Administration | GPA: 3.3/4.0 **May 2021**
Relevant Courses: Data Structures, Foundations of Programming, Cyber Security
Dean's List

TECHNICAL SKILLS

Languages	Go, Python, Java, SQL, JavaScript/TypeScript, Swift
Systems & Security	macOS sandboxing (Seatbelt), Unix sockets and file-descriptor passing, content-addressed storage, WebAssembly
AI / LLM	OpenAI Codex app-server, OpenAI and Claude APIs, MCP, RAG
Cloud & DevOps	AWS (EC2, S3, Lambda, EKS), Terraform, Docker, Prometheus, Grafana
Frontend & Data	React, SwiftUI, Metal, Tableau, Pandas, NumPy

PROJECTS

Skyra | Creator and sole engineer | skyra-site.tailbf7003.ts.net **March 2026 – Present**

- Designed and built a runtime in standard-library Go that runs OpenAI Codex agents under per-call macOS sandboxes generated from a single human grant, so agents extend themselves without per-action approval while the OS enforces the boundary.
- Made every step a content-addressed, hash-chained record re-derived by one pure state-transition function; full runs replay byte-identically, and replay compiles to WebAssembly so visitors verify recorded runs in their own browser.
- Built a stateless controller (one process per step) that hands work between processes over Unix sockets, passing directory file descriptors, so a crash at any point leaves nothing to recover but the record tree.
- Shipped browser, terminal and native macOS (SwiftUI, Metal) clients on one protocol, and rewrote a working 7,000-line predecessor after identifying a flaw in its authority model.

RELEVANT EXPERIENCE

RoonCyber | Co-Op Engineer | Boston, MA **May 2025 – June 2026**

- Built an LLM-powered security chatbot using an MCP server + RAG architecture that integrated with real customer security data, enabling natural-language querying and rapid insight extraction across the platform.
- Designed and implemented a distributed, pull-model data ingestion system that securely extracted telemetry from customer AWS accounts and centralized it into a scalable database for analysis and automation.
- Supported and contributed to successful SOC 2 Type II audit completion, improving evidence workflows, access controls, and documentation across engineering and security teams.

440 Labs | Engineer | Boston, MA **2021 – 2022**

- Deployed and oversaw Prometheus and Grafana monitoring to track and optimize service performance across the business, increasing operational efficiency on AWS EC2 and clusters.
- Managed deployment and decommissioning of architecture components with Terraform, controlling costs and maintaining budget adherence.
- Oversaw application security and safeguarding of sensitive data, along with backups for critical services, developer access, and performance metrics, ensuring system integrity and continuity.
